## Data Types and Data Structures

**Data types.** Set of values and operations on those values.

- Some are built into the Java language: `int`, `double[]`, `String`, ...
- Most are not: `Complex`, `Picture`, `Stack`, `Queue`, `ST`, `Graph`, ...

↑  
this lecture

**Data structures.**

- Represent data or relationships among data.
- Some are built into Java language: arrays.
- Most are not: linked list, circular list, tree, sparse array, graph, ...

↑                    ↑  
this lecture    TSP assignment

## Collections

**Fundamental data types.**

- Set of operations (**add**, **remove**, **test if empty**) on generic data.
- Intent is clear when we insert.
- Which item do we remove?

**Stack.** [LIFO = last in first out]

- Remove the item most recently added.
- Ex: cafeteria trays, Web surfing.

← This lecture

**Queue.** [FIFO = first in, first out]

- Remove the item least recently added.
- Ex: Line for help in TA office hours.

← Guitar Hero Assignment

**Symbol table.**

- Remove the item with a given key.
- Ex: Phone book.

3

## Stacks

4

## Stack API

```
public class *StackOfStrings
{
    *StackOfStrings() create an empty stack
    boolean isEmpty() is the stack empty?
    void push(String item) push a string onto the stack
    String pop() pop the stack
}
```

5

## Stack Client Example 1: Reverse

```
public class Reverse {
    public static void main(String[] args) {
        StackOfStrings stack = new StackOfStrings();
        while (!StdIn.isEmpty()) {
            String s = StdIn.readString();
            stack.push(s);
        }
        while (!stack.isEmpty()) {
            String s = stack.pop();
            StdOut.println(s);
        }
    }
}
```

```
% more tiny.txt
it was the best of times
```

```
times
of
best
the
was
it
```

← stack contents when standard input is empty

6

### Stack: Array Implementation

Array implementation of a stack.

- Use array a[] to store N items on stack.
- push() add new item at a[N].
- pop() remove item from a[N-1].

how big to make array? [stay tuned]

stack and array contents after 4<sup>th</sup> push operation

```

public class ArrayStackOfStrings {
    private String[] a;
    private int N = 0;
    public ArrayStackOfStrings(int max) { a = new String[max]; }
    public boolean isEmpty() { return (N == 0); }
    public void push(String item) { a[N] = item; N++; }
    public String pop() { N--; return a[N + 1]; }
}
    
```

temporary solution: make client provide capacity

### Linked Lists

### Sequential vs. Linked Allocation

**Sequential allocation.** Put items one after another.

- TOY: consecutive memory cells.
- Java: array of objects.

**Linked allocation.** Include in each object a link to the next one.

- TOY: link is memory address of next item.
- Java: link is reference to next item.

**Key distinctions.**

- Array: random access, fixed size.
- Linked list: sequential access, variable size.

addr	value	addr	value
B0	"Alice"	C0	"Carol"
B1	"Bob"	C1	null
B2	"Carol"	C2	-
B3	-	C3	-
B4	-	C4	"Alice"
B5	-	C5	CA
B6	-	C6	-
B7	-	C7	-
B8	-	C8	-
B9	-	C9	-
BA	-	CA	"Bob"
BB	-	CB	C0

array (B0)      linked list (C4)

get 3<sup>rd</sup> item (points to B2)

get next item (points from B2 to B3)

### Linked Lists

**Linked list.**

- A recursive data structure.
- An item plus a pointer to another linked list (or empty list).
- Unwind recursion: linked list is a sequence of items.

**Node data type.**

- A reference to a string.
- A reference to another Node.

```

public class Node {
    public String item;
    public Node next;
}
    
```

special pointer value null terminates list

### Building a Linked List

```

Node third = new Node();
third.item = "Carol";
third.next = null;

Node second = new Node();
second.item = "Bob";
second.next = third;

Node first = new Node();
first.item = "Alice";
first.next = second;
    
```

addr	Value
C0	"Carol"
C1	null
C2	-
C3	-
C4	"Alice"
C5	CA
C6	-
C7	-
C8	-
C9	-
CA	"Bob"
CB	C0
CC	-
CD	-
CE	-
CF	-

main memory

### Stack Push: Linked List Implementation

```

Node second = first;
first = new Node();
first.item = "of";
first.next = second;
    
```

### Stack Pop: Linked List Implementation

### Stack: Linked List Implementation

```

public class LinkedStackOfStrings {
    private Node first = null;

    private class Node {
        private String item;
        private Node next;
    }

    public boolean isEmpty() { return first == null; }

    public void push(String item) {
        Node second = first;
        first = new Node();
        first.item = item;
        first.next = second;
    }

    public String pop() {
        String item = first.item;
        first = first.next;
        return item;
    }
}
    
```

### Stack Data Structures: Tradeoffs

Two data structures to implement stack data type.

**Array.**

- Every push/pop operation take constant time.
- But... must fix maximum capacity of stack ahead of time.

**Linked list.**

- Every push/pop operation takes constant time.
- Memory is proportional to number of items on stack.
- But... uses extra space and time to deal with references.

### List Processing Challenge 2

Q. What does the following code fragment do?

```

Node last = new Node();
last.item = StdIn.readString();
last.next = null;
Node first = last;
while (!StdIn.isEmpty()) {
    last.next = new Node();
    last = last.next;
    last.item = StdIn.readString();
    last.next = null;
}
    
```
