Recitation 8

Boooooooooost, HTTP & Project Overview

Logistics

- HW02 due yesterday
- HW03 release sometime this week
 - VM related concepts
- We will provide an overview in next recitation

BOOOOOOOOST

BOOST

Boost is a free C++ library that provides support for various tasks in C++

- **Note:** Boost does NOT follow the Google style guide!!!

Boost adds many string algorithms that you may have seen in Java

- Include with `#include <boost/algorithm/string.hpp>`

We are showcasing a few we think could be useful for HW4, but more can be found here:

- https://www.boost.org/doc/libs/1_60_0/doc/html/string_algo.html

trim

```
void boost::trim(string& input);
```

- Removes all leading and trailing whitespace from the string
- input is an input *and* output parameter (non-const reference)

```
string s("    HI    ");
boost::algorithm::trim(s);

// results in s == "HI"
```

replace_all

```
void boost::replace_all(string& input, const string& search,  
                      const string& format);
```

- Replaces all instances of `search` inside `input` with `format`

```
string s("ynrnrt");  
boost::algorithm::replace_all(s, "nr", "e");  
// results in s == "yeet"
```

replace_all

```
void boost::replace_all(string& input, const string& search,  
                      const string& format);
```

- Replaces all instances of `search` inside `input` with `format`

```
string s("queue?");  
boost::algorithm::replace_all(s, "que", "q");  
// results in s == "que?"
```

`replace_all()` guarantees that
'format' will be in the final result
if-and-only-if 'search' existed.

`replace_all()` makes a *single*
pass over `input`.

split

```
void boost::split(vector<string>& output,  
                  const string& input,  
                  boost::PredicateT match_on,  
                  boost::token_compress_mode_type compress);
```

- Split the string by the characters in `match_on`

```
boost::PredicateT boost::is_any_of(const string& tokens);
```

- Returns predicate that matches on any of the characters in `tokens`

split Examples

```
vector<string> tokens;  
  
string s("I-am--split");  
  
boost::split(tokens, s, boost::is_any_of("-")  
            boost::token_compress_on);  
// results in tokens == ["I", "am", "split"]  
  
boost::split(tokens, s, boost::is_any_of("-")  
            boost::token_compress_off);  
// results in tokens == ["I", "am", "", "split"]
```

Exercise 1

Write a function that takes in a string that contains words separated by whitespace and returns a vector that contains all of the words in that string, in the same order as they show up, but with no duplicates. Ignore all leading and trailing whitespace in the input string.

Example:

```
RemoveDuplicates(" Hi I'm sorry  jon sorry hi hihi  hi hi      ")  
should return the vector ["Hi", "I'm", "sorry", "jon", "hi", "hihi"]
```

```
vector<string> RemoveDuplicates(const string& input) {  
    string copy(input);  
    boost::algorithm::trim(copy);  
    std::vector<string> components;  
    boost::split(components, copy, boost::is_any_of(" \t\n"),  
                 boost::token_compress_on);  
    std::vector<string> result;  
    for (uint i = 0; i < components.size(); ++i) {  
        bool unique = true;  
        for (uint j = 0; j < i && unique; ++j) {  
            unique &= !(components[i] == components[j]);  
        }  
        if (unique) {  
            result.push_back(components[i]);  
        }  
    }  
    return result;  
}
```

HTTP Review

HTTP Review

1. What does HTTP stand for?

HyperText Transfer Protocol

1. What layer does HTTP reside in?

Application Layer

HTTP Request Format

[METHOD] [request-uri] HTTP/[version]\r\n

[headerfield1]: [fieldvalue1]\r\n

[headerfield2]: [fieldvalue2]\r\n

[...]

[headerfieldN]: [fieldvalueN]\r\n

\r\n

[request body, if any]

HTTP Methods

	GET	The GET method requests a representation of the specified resource. Requests using GET should only retrieve data.
	HEAD	The HEAD method asks for a response identical to that of a GET request, but without the response body.
	POST	The POST method is used to submit an entity to the specified resource, often causing a change in state or side effects on the server.
	PUT	The PUT method replaces all current representations of the target resource with the request payload.
	DELETE	The DELETE method deletes the specified resource.
	CONNECT	The CONNECT method establishes a tunnel to the server identified by the target resource.
	OPTIONS	The OPTIONS method is used to describe the communication options for the target resource.
	TRACE	The TRACE method performs a message loop-back test along the path to the target resource.
	PATCH	The PATCH method is used to apply partial modifications to a resource.

HTTP Response Format

HTTP/ [version] [status code] [reason] \r\n

[headerfield1]: [fieldvalue1] \r\n

[headerfield2]: [fieldvalue2] \r\n

[...]

[headerfieldN]: [fieldvalueN] \r\n

\r\n

[response body, if any]

HTTP Response Status Codes

- HTTP/1.1 200 OK
 - The request succeeded and the requested object is sent
- HTTP/1.1 404 Not Found
 - The requested object was not found
- HTTP/1.1 301 Moved Permanently
 - The object exists, but its name has changed
 - The new URL is given as the “Location : ” header value
- HTTP/1.1 500 Server Error
 - The server had some kind of unexpected error

Version

HTTP/1.1 200 OK

Status

Date: Mon, 21 May 2018 07:58:46 GMT

</body></html>
```

Response body

Writing an HTTP Request

- Example HTTP Request layout can be found in `HttpRequest.h`
- Example file request:
 - `GET /static/test_tree/books/artofwar.txt HTTP/1.1`
- Example query request:
 - `GET /query?terms=books+of+war HTTP/1.1`
- **Compare the html output of `./solution_binaries/httpd` to your `./httpd`**

Exercise 1

Exercise 4

Write a function called `ExtractRequestLine` that takes in a well-formatted HTTP request as a `string` and returns a `map` with the keys as `method`, `uri`, `version` and the values from the corresponding request.

Example Input:

```
"GET /index.html HTTP/1.1\r\nHost: www.mywebsite.com\r\nConnection: keep-alive\r\nUpgrade-Insecure-Requests: 1\r\n\r\n"
```

Map Returned:

```
{
    "method" : "GET"
    "uri"     : "/index.html"
    "version" : "HTTP/1.1"
}
```

Exercise 1

```
map<string, string> ExtractRequestLine(const string& request) {  
    vector<string> lines;  
    boost::split(lines, request, boost::is_any_of("\r\n"),  
                boost::token_compress_on);  
    vector<string> components;  
    string firstLine = lines[0];  
    boost::split(components, firstLine, boost::is_any_of(" "),  
                boost::token_compress_on);  
    map<string, string> res;  
    res["method"] = components[0];  
    res["uri"] = components[1];  
    res["version"] = components[2];  
    return res;  
}
```
